Happy 15th Anniversary!

1998-2013

It's hard to believe it's been 15 years since we opened the doors of Meyers Auto Tech. Do you remember the old two-bay shop down at the Richland "Y"? Seems like a distant memory. We've come a long way since then and been so blessed by the Lord and our wonderful customers!

Last year you helped raise over \$4,000 for Jericho Road Ministries!

We want to show our appreciation by designating **AUGUST** as

Meyers Mission Month!

This year we are happy to highlight **Ignite Youth Mentoring!** IYM is a faith-based organization determined to provide positive, safe, and encouraging adults to kids in need of a quality role model.

We appreciate the fact that IYM is dedicated to reaching out to the community around them by providing Christian mentors to children. You can help by coming in to have your vehicle serviced anytime during the month of August. This will help us to donate a portion of our proceeds to this very deserving organization.

If you're interested in volunteering, donating, or want to learn more about their organization, visit them at IgniteYouthMentoring.com.

Meyers Mission Month—"Helping God's People Do God's Work."

Welcome, De'Ann!

We are so happy to introduce our newest team member! **De'Ann** lives in Kennewick with her two boys. She was born and raised right here in the Tri-Cities. Come on by sometime and say hello.

"I have spent many years in the customer service industry. I appreciate the challenge that Meyers Auto Tech has given me. I look forward to meeting all of our loyal customers! Thank you." De'Ann

Steering wheel shake 'n' brake

There are a number of causes of vibrations in the steering column—bent rims, bad CV joints, a busted motor mount, loose lug nuts—but when it only happens while braking, there's one prime suspect: your brake rotors.

Rotors are discs that your brake pads clamp down on in order to slow down or stop your car. When braking, rotors are exposed to tremendous friction and heat, which will wear them down over time. The metal may thin out and become uneven or warped in some spots. When the brake pads grip these now-uneven surfaces at high speeds, the imperfections cause a rumbling in the brake pedal that can also be felt through the steering wheel.

It's best to bring your car to us as soon as you can if your brakes make your steering wheel shiver. Chronic vibrations can cause calipers, bolts, brake pads, and other components of your brake system to loosen or wear out more quickly. A relatively small bill can balloon in a hurry.

At our shop, we can diagnose warped rotors by spinning the rotors and feeling for imperfections. Occasionally, rough spots can be "shaved" to even out the surface ("turning" the rotors). Many times, however, this will not be cost-effective, and less metal means an increased chance of rewarping. It's common practice to replace rotors and brake pads at the same time. If you're lucky, tightening of the rotors may be all that's needed to fix the problem.

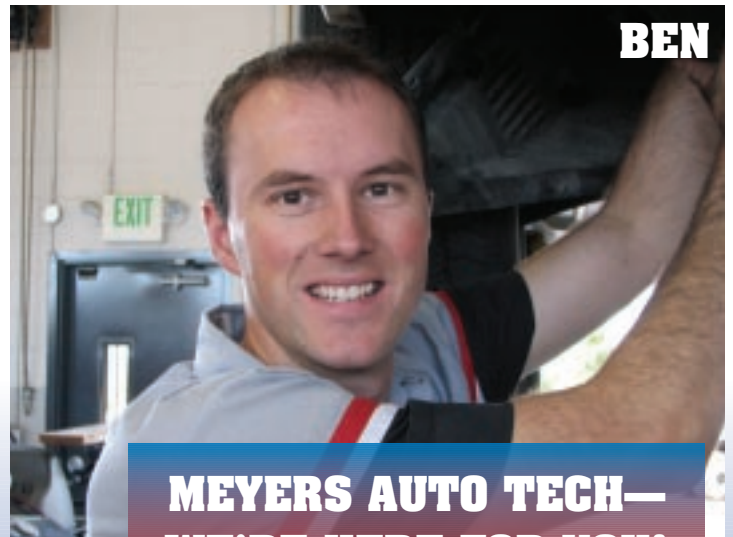

Don't mess with your brakes. Call us today if they give you the shakes.
